# Outline

## **Backgrounds & Objectives**

## **Methods**

- ◆ Study area
- ◆ DSA : Stochastic simulation models
- ◆ DSA : Evaluation models for forest functions

## **Results of applying the DSA**

## **Summary**

# The role of local forest policy

Target amounts of annual timber supply  
in Japan (million m )

To supply ecosystem services sustainably.

# Challenges of local forest policy

I do what I want!

Considering multiple decision makers.

## Objectives: Developing a DSA that

- ❑ Estimates impacts of policies to enhance wood production, and
- ❑ Suggests policies that alleviate the impacts

By a simulation model considering multiple decision makers.

# Methods

**Decision Support Approach**

# Study area : Kitaibaraki, Japan

- Plans to increase timber production.
- Preserve forest functions for local residents.

# To estimate impacts the DSA contains:

- Stochastic simulation models, and

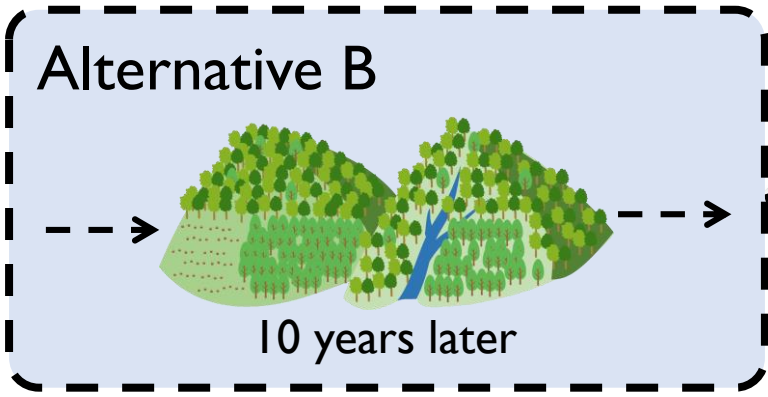

- Evaluation models for forest functions.

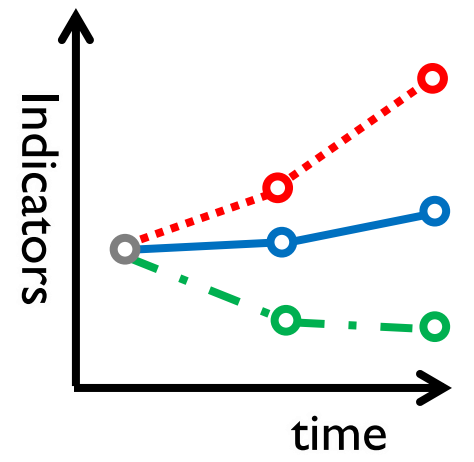

# Stochastic Simulation

# Evaluation models

- Wood production
- Biodiversity
- Soil erosion
- Landslide
- Carbon
- Recreation

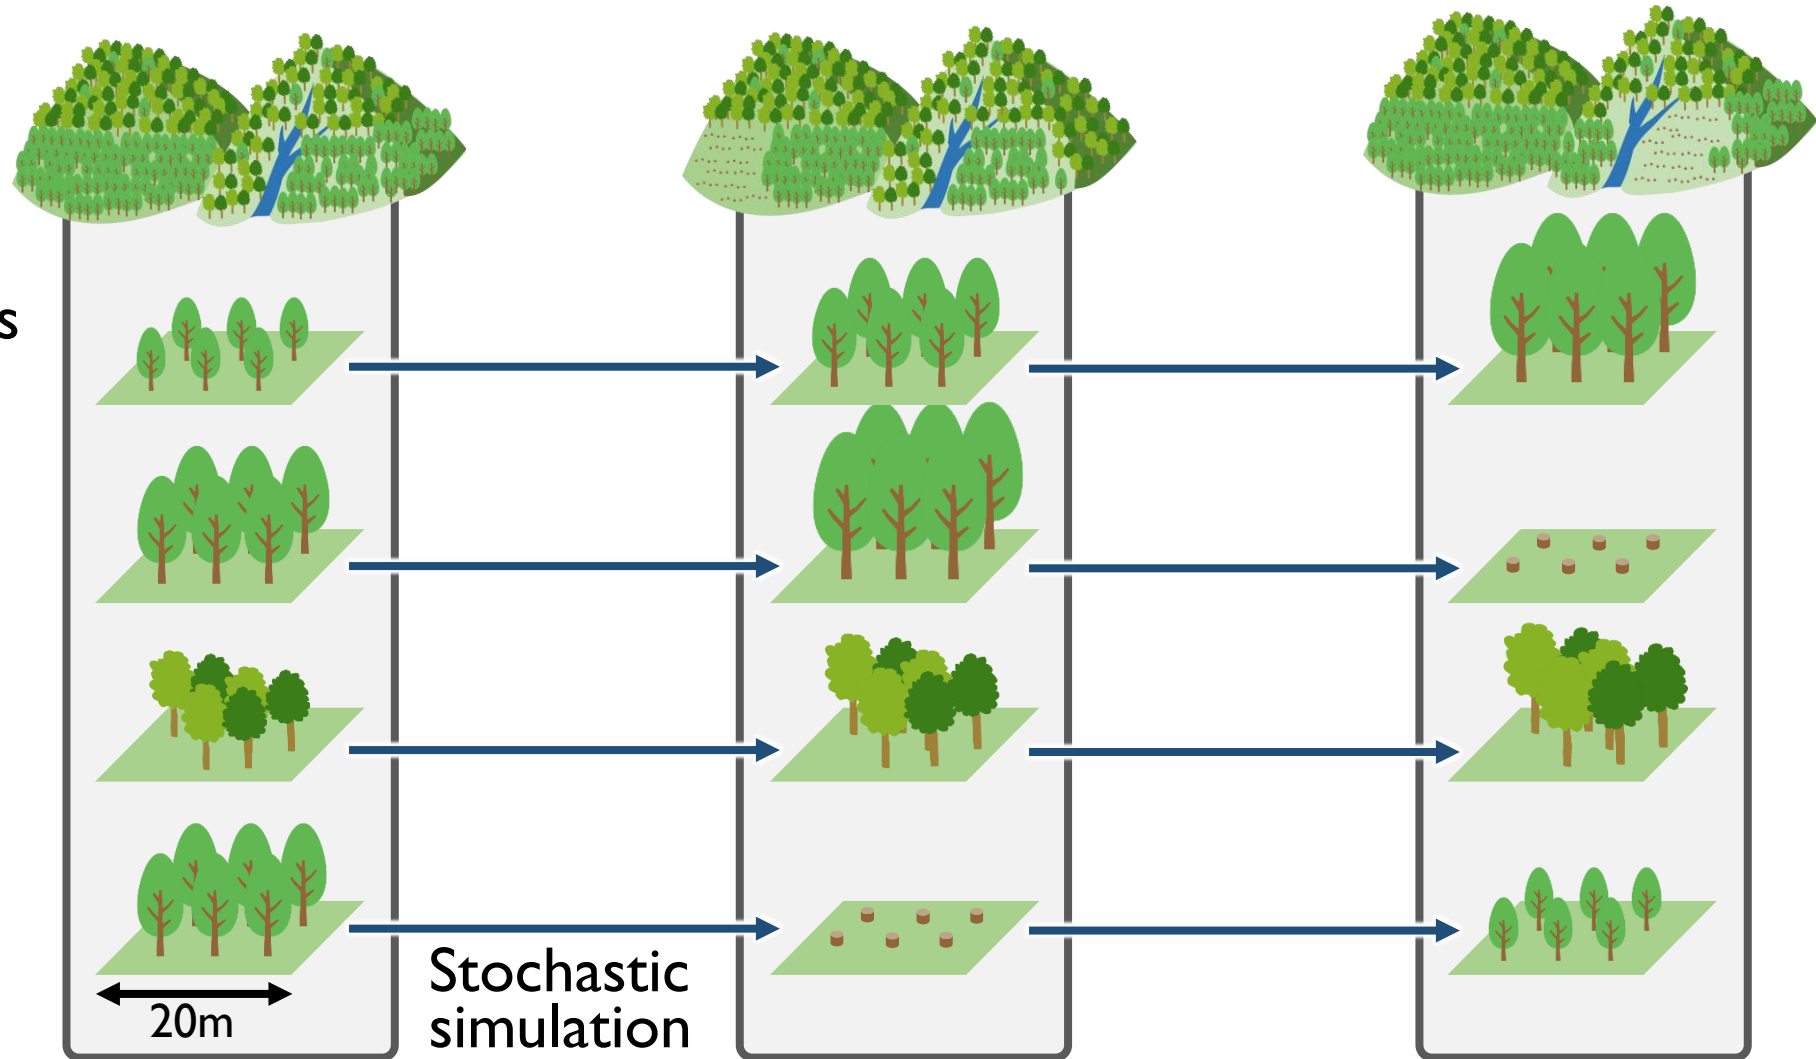

The changes of indicators in different alternatives

- Alternatives
- A ..... (red dotted)
  - B ——— (blue solid)
  - C - . - . (green dash-dot)

# Microsimulation: simulating each forest separately

Dividing forests into 20m cells

# Microsimulation: simulating each forest separately

Steep forest

Harvest probability

Harvest probability dependent on forest conditions

Moderate forest

Harvest probability

Harvest probability dependent on forest conditions

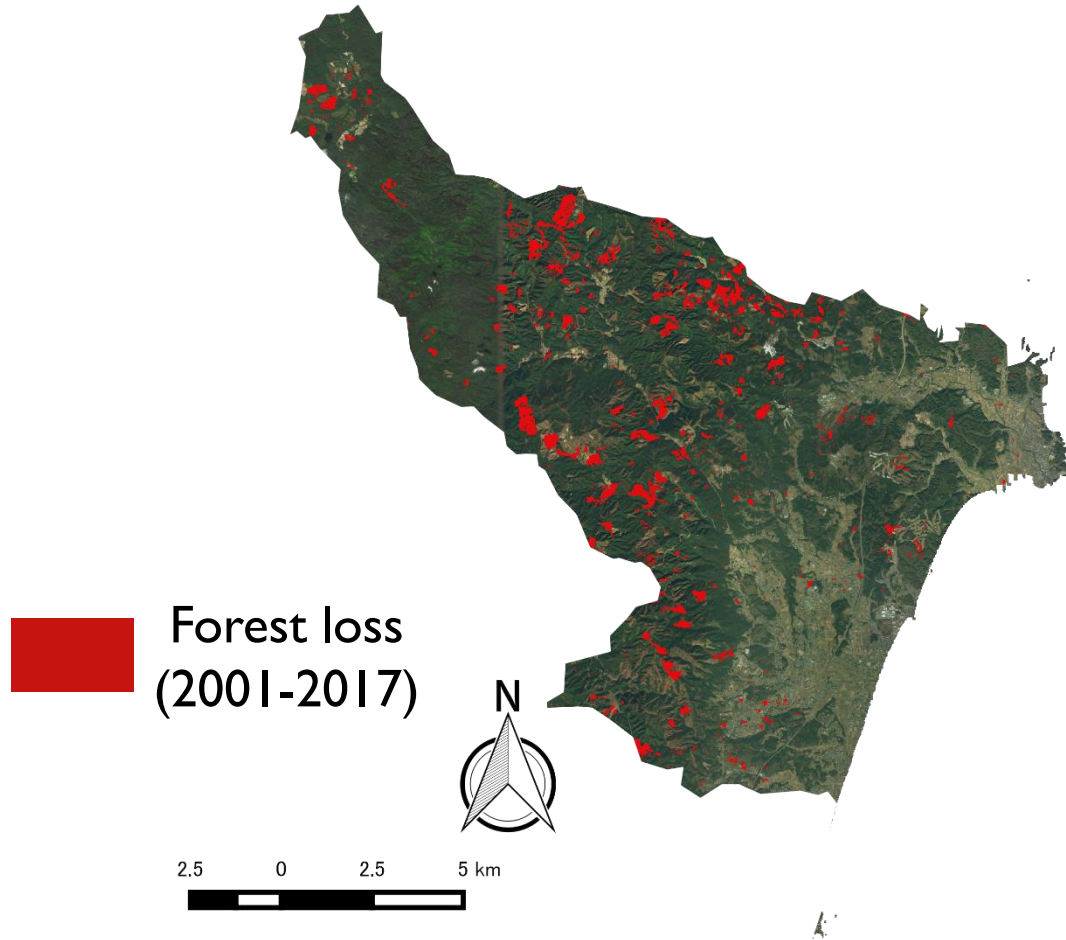

**Harvest probabilities depend on forest conditions.**

# Harvest probabilities: estimated from data

Extracting harvested forest from  
“Forest loss” map (Hansen et al., *Science* 2013)

Analyzing conditions of harvested forest and  
estimate harvest probabilities

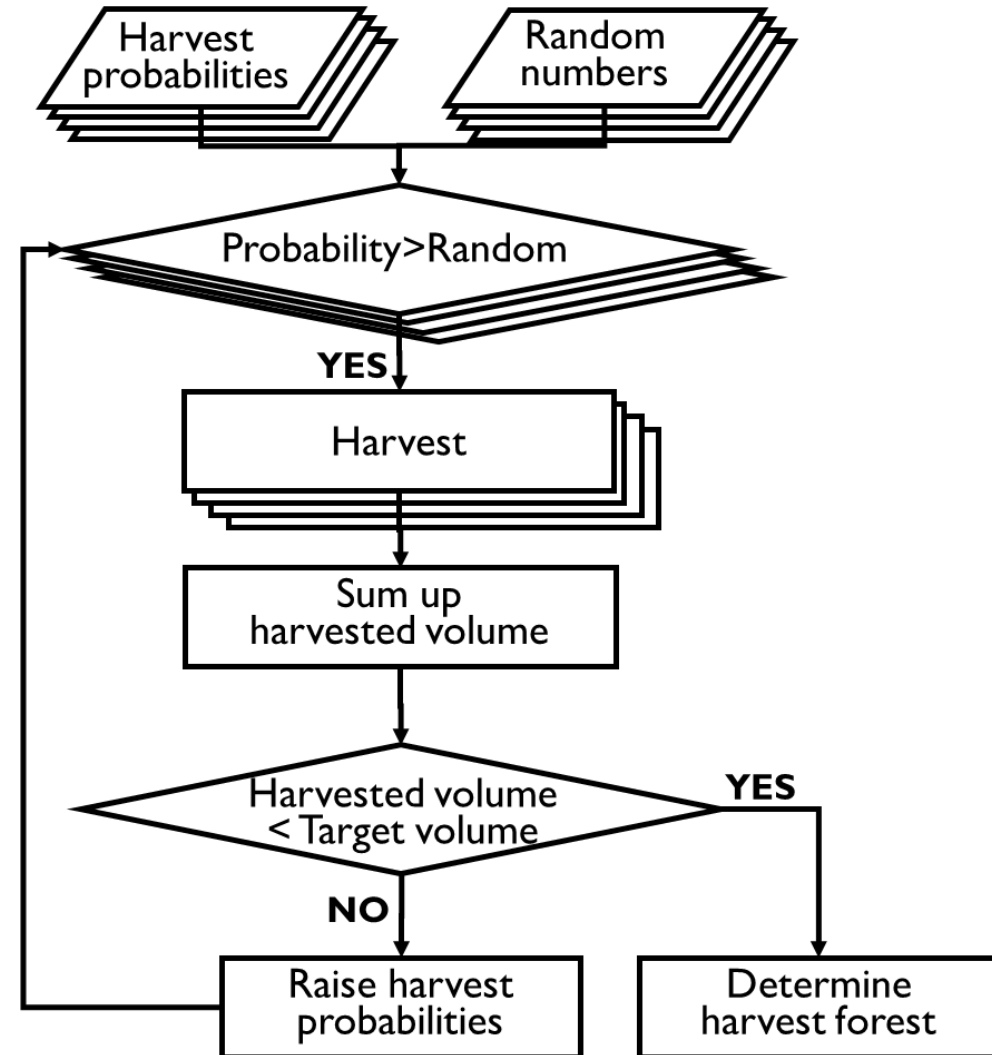

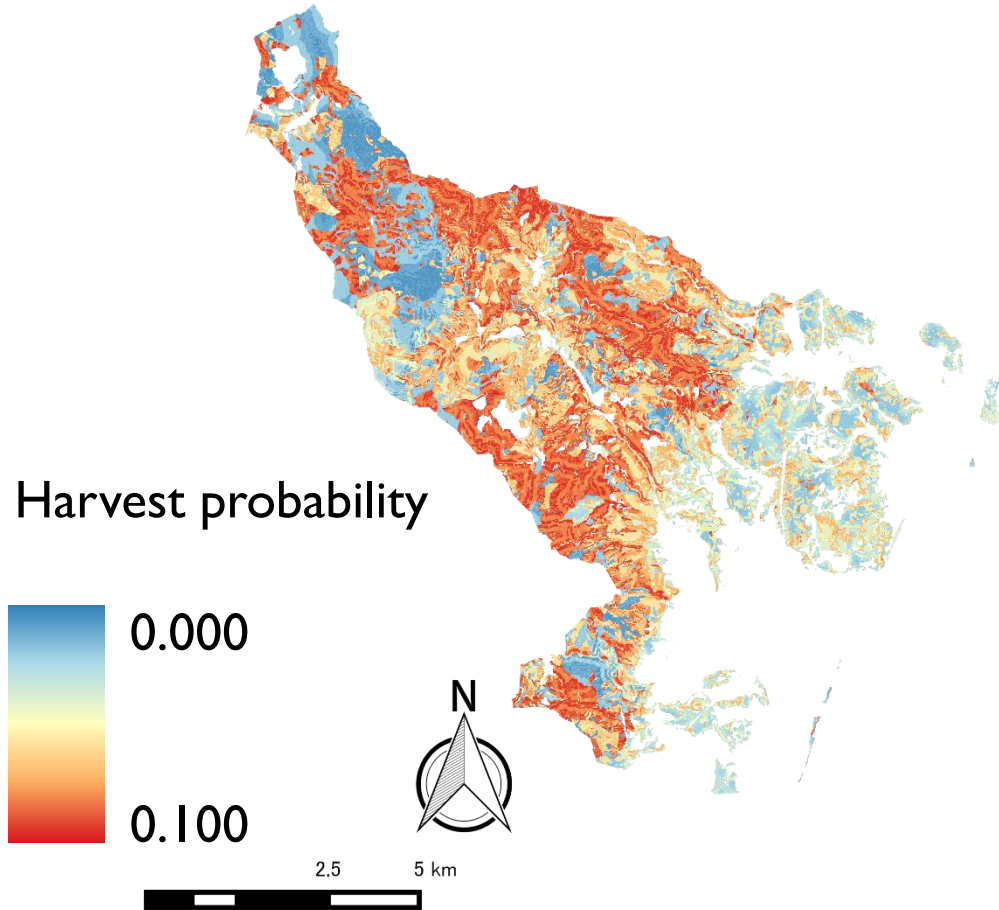

Private forest or National forest

Planted forest or Natural forest

Slope angle (0-, 15-, 30-, 35-)

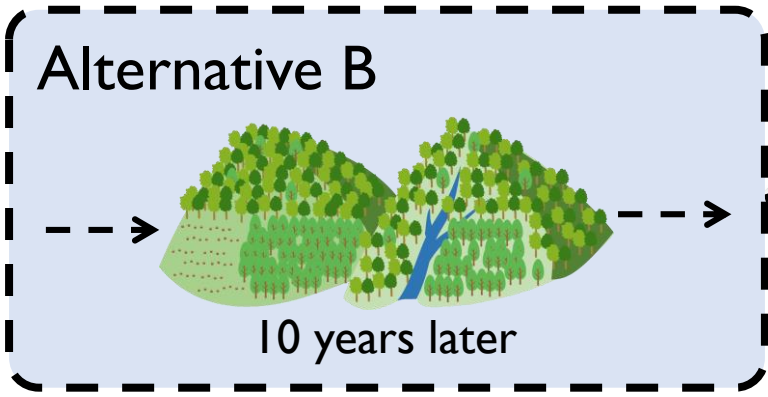

Distance from road (0-, 100-, 200-, 300-)

# Harvest probabilities: estimated from data

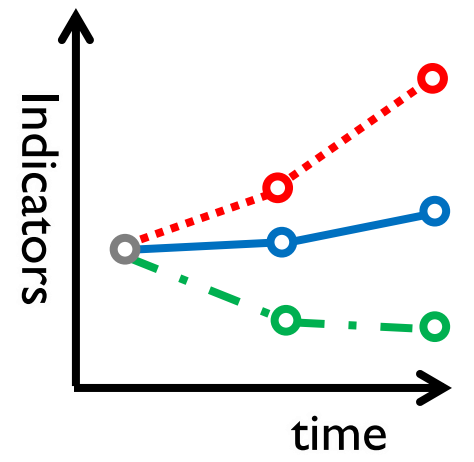

# Stochastic Simulation

# Evaluation models

- Wood production
- Biodiversity
- Soil erosion
- Landslide
- Carbon
- Recreation

The changes of indicators in different alternatives

- Alternatives
- A ..... (red dotted)
  - B ——— (blue solid)
  - C - . - . (green dash-dot)

---

Functions	Indicator	Reference
 <b>Forestry</b>	Indicator for forestry profitability	Yamizo Taga Regional Forest Plan
 <b>Biodiversity</b>	Estimated density of large diameter trees, BA.	Yamaura et al. (2019)
 <b>Soil erosion</b>	Amounts of eroded soil estimated by RUSLE method.	Renard et al. (1997)
 <b>Landslide</b>	Ratio of forest area with high risk of landslides.	Forestry agency (2006)
 <b>Carbon</b>	Carbon pools above and belowground parts in the area.	IPCC (2006)
 <b>Recreation</b>	Indicator for accessibility and amenity	FFPRI(1995), Sugimura (2001), Takayama (2012)

---

# Stochastic Simulation

# Evaluation models

 Landslide		-	+ +	+	+
 Carbon		-		+	+
 Recreation		-	-		- -

## Summary: We developed a DSA for regional forest management.

- ❑ Policies have both positive and negative effects.
- ❑ Combining different policies is important for SFM.

## Conclusion:

- ❑ A stochastic simulation offers suggestive information.
- ❑ Policy makings should be with comprehensive view points.

**The DSA can be a useful tool for regional SFM.**

Further study would be:

- ❑ Verifying and improving accuracies of the simulation
- ❑ Organizing the approach to be a decision support system.

Obriqadado!
