**“I think it’s wrong that  
only one company  
makes the game  
Monopoly”**

**Steven Wright**

# Introduction

- Harvest schedule modeling has advanced at a fast pace over the last 30 years
  - “There is nothing we could not model, we just need a good data” Dr. Roise
- Optimal allocation of resources:
  - Maximize Net Present Value (NPV) subject to a set of constraints
- Timber prices are normally exogenous
  - Competitive market? All the time?

# Introduction

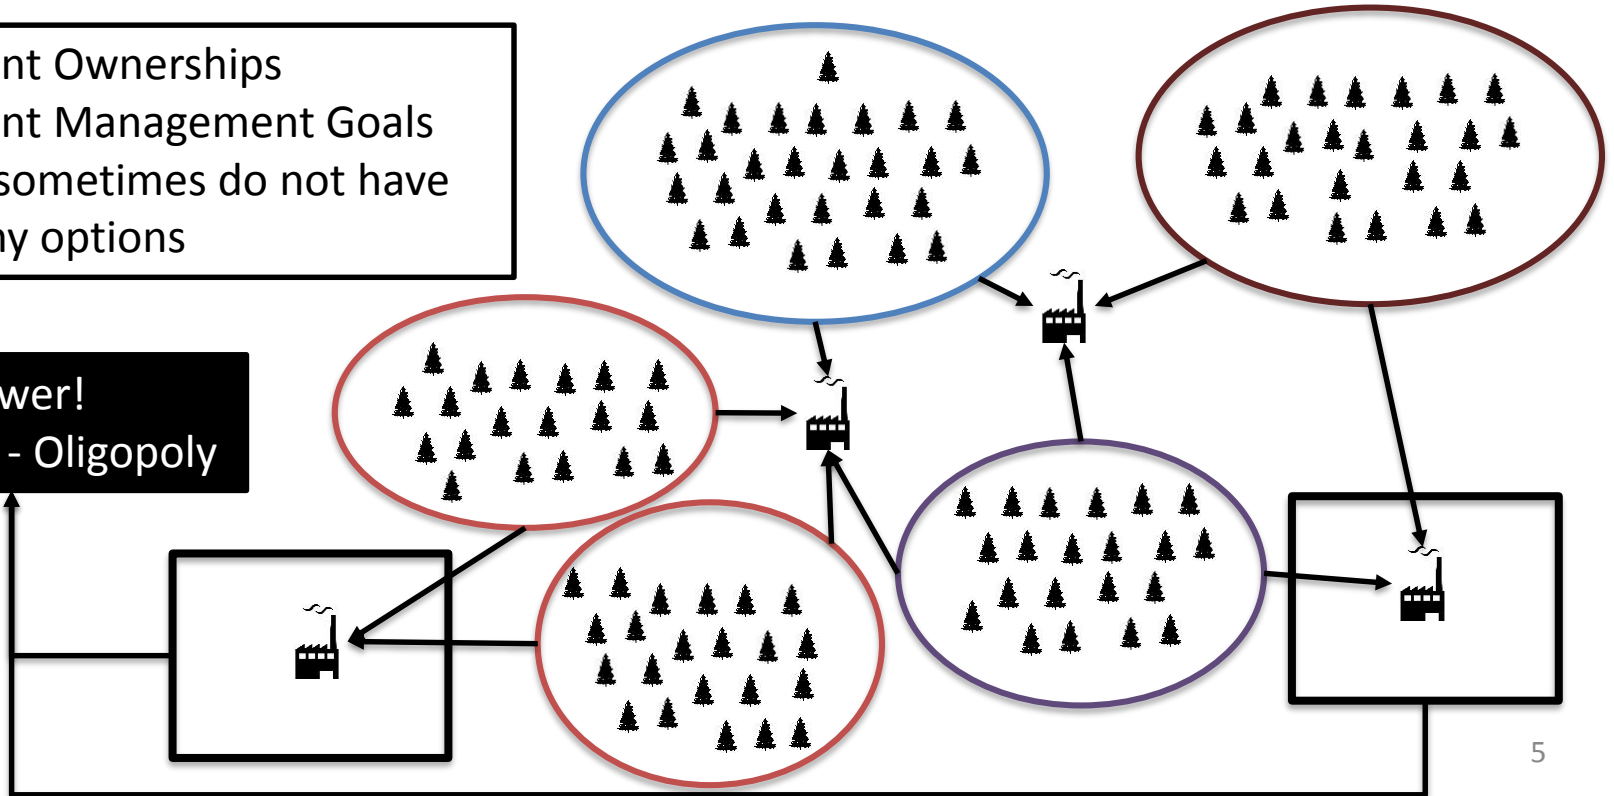

- Timber Markets are commonly dominated by few mills (Oligopsony power)
  - US South (Mei et al 2008, Silva et al 2019)
  - Scandinavia ( Bergman and Branlunnd 1995)

# Timber Markets:

- Different Ownerships
- Different Management Goals
- Buyer sometimes do not have as many options

Market Power!  
Monopoly - Oligopoly

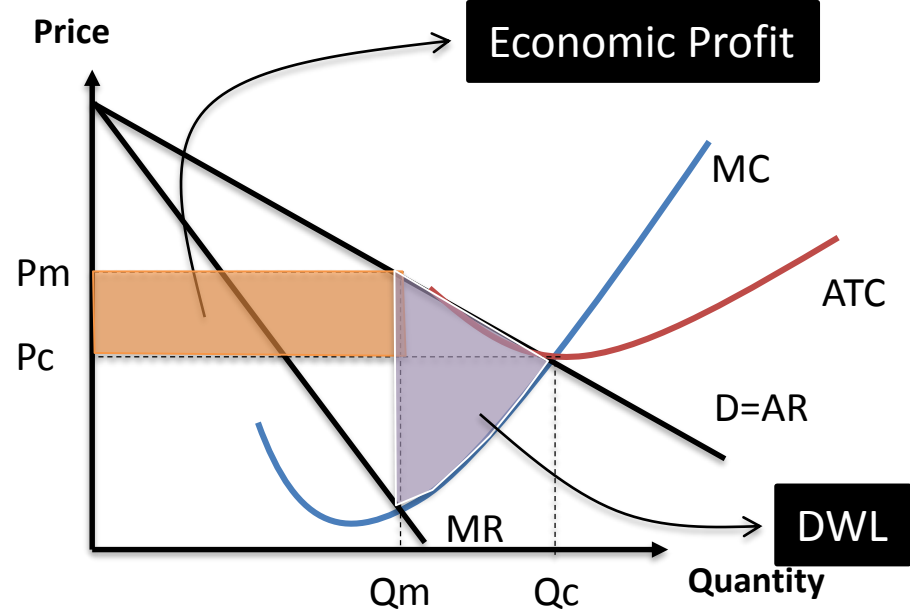

# Market Structure

Perfect Competition

Monopoly

# Modeling

$$\max_{st} \pi_{im} = \sum_t^T (q_{itm} P_{tm}(Q_{tm}^s) - C_{itm}) \delta_t$$

$$Z = A$$

$$P_{tm} = \beta Q_{tm}^s + \alpha I_{tm}$$

$$Q_{tm}^s = Q_{tm}^d$$

where

$$Q_{tm}^s = q_{itm}^s + W_{tm}^s$$

$$I_{tm} = inv_{itm} + Inv_{tm}$$

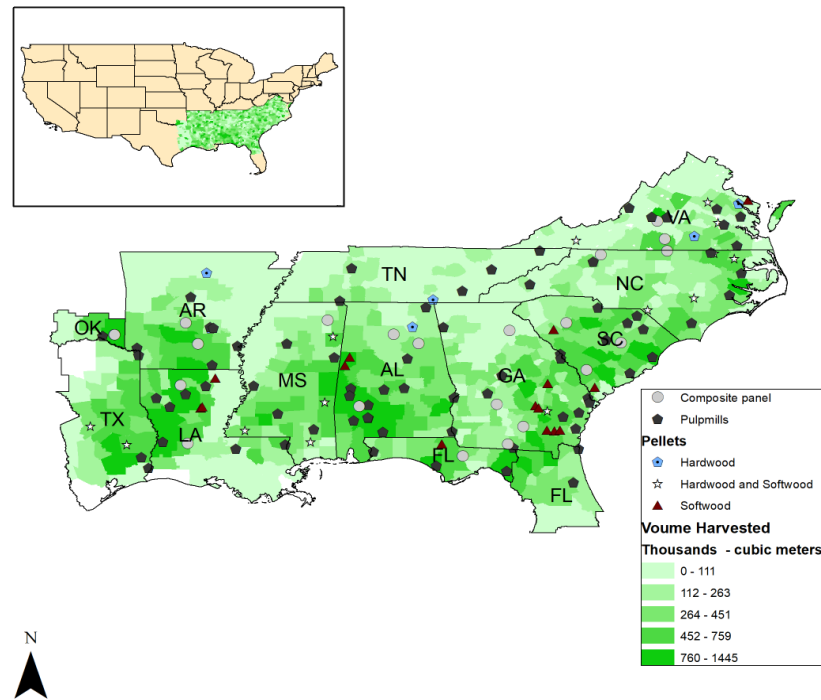

$Q_{tm}^d$ : Exogenous demand

- $P_{tm}$ : Timber Prices at market  $m$  during  $t$
- $Q_{tm}^{s(d)}$ : Quantity Supplied (Demanded)
  - $q_{it}^s$ : Quantity Supplied by firm  $i$
  - $W_{tm}^s$ : Quantity Supplied by “market”
- $C_{itm}$ : Costs of firm  $i$
- $Z$  and  $A$ : Operational Constraints
- $I_{tm}$ : Total inventory at period  $t$ .
  - $Inv_{itm}$ : Inventory at firm  $i$
  - $Inv_{tm}$ : “market” inventory
- $\alpha$  and  $\beta$ : Price elasticities.

# Dataset

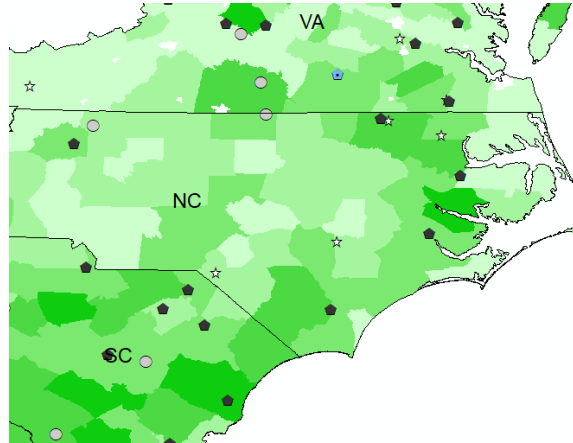

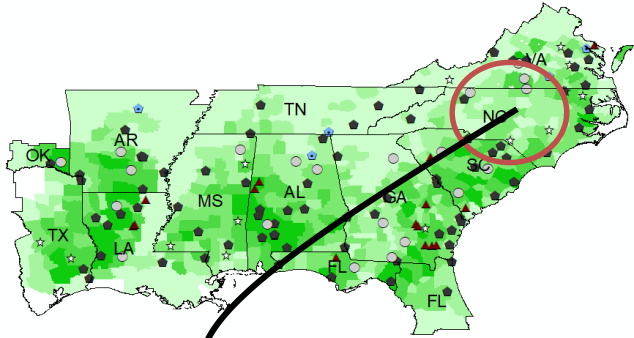

## Simulation

- Stand Characteristics
  - Plot level – Forest Inventory and Analysis (FIA) - Sampling
  - Cost from consulting firms
  - Yield Tables - Forest Vegetation Simulator
- Market Characteristics
  - SubRegional Timber Supply (SRTS)
  - Timber Product Output (TPO) - Demand

# Simulation

Monopoly

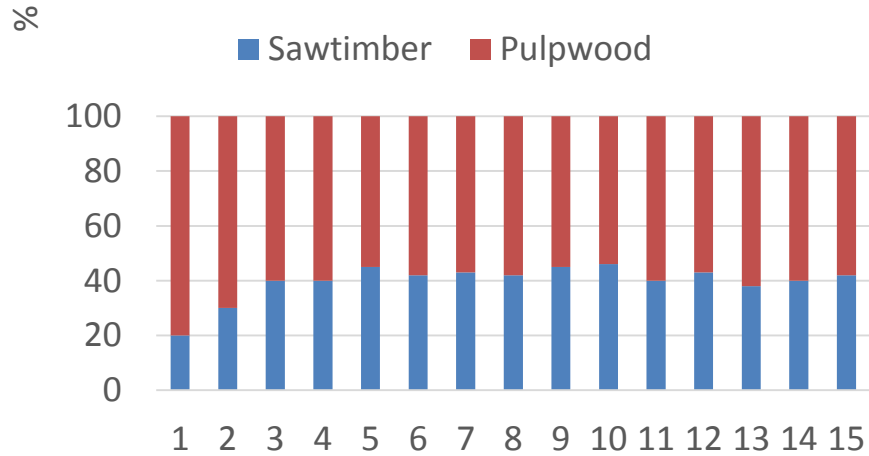

Perfect Competition

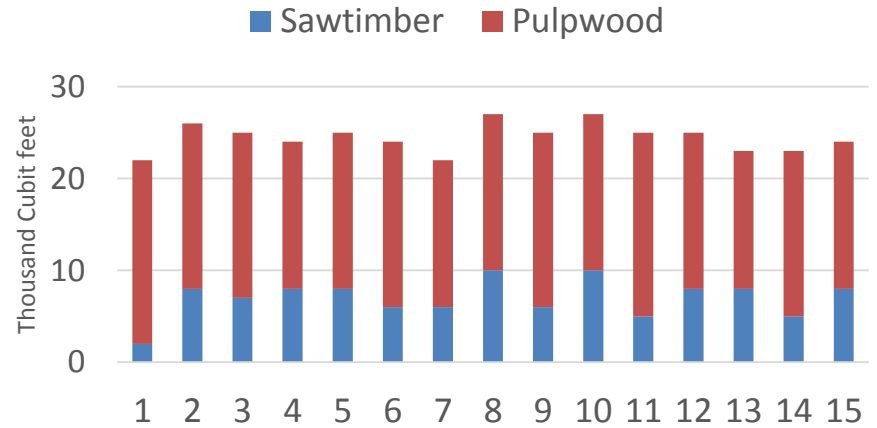

# Results (Monopoly)

## Stock

## Harvesting

# Results

Structure	Difference (Comp - Monopoly)
Price	- 14.5%
Harvesting	-12.5%
Stock	+10.5%

# Take home message

- Assuming perfect competition in the timber market is never true; it will have some degree of oligopsony or oligopoly in any place in the world
- In a monopoly, prices will be higher and quantity will be less than in a perfect competitive market
- Initial investments and regulations might affect the entry of new timberland investors

# Next Steps

- To use real timberland asset - Hoffman Forest (North Carolina)
- To add Game theory concepts, Nash Equilibrium, into harvest schedule models
- To build a friendly interface

**Thank you**
