## Introductory remarks

Slovak forestry needs and situation in DSS implementation

TUZVO activities

# Adaptive Forest Management – Decisive foundations

(by Hainimann, 2010)

## 1. Dynamic ecosystems behavior,

Emergence, Adaptation, Resilience: „purposeuseful change“.

## 2. Space – scale matters,

Patch/Stand as a space – time window for traditional silviculture-based forestry.

## 3. Risk informed management,

Critical effect, dose-response relationships.

# Melding the Minds of the “-ists” and “-ologists”

## BEYOND MAPPING

The “-ists” — and — The “-ologists”

...understand the “tools” that can be used to display, query and analyze spatial data

...understand the “science” behind spatial relationships that can be used for decision-making

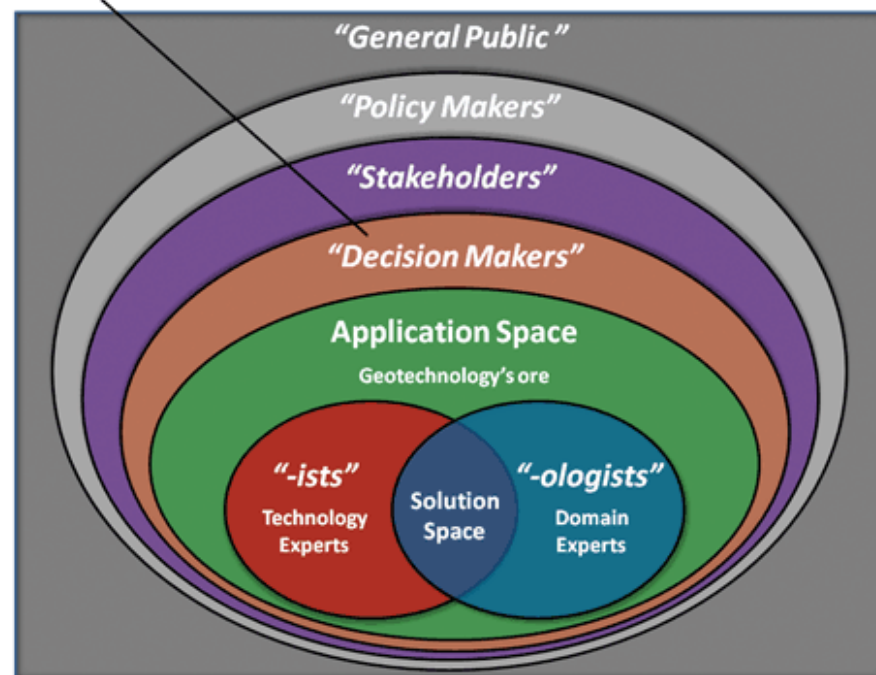

Data and Information focus Knowledge and Wisdom focus

Together the “-ists” and the “-ologists” frame and develop the Solution for an application.

Decision Makers utilize the Solution under Stakeholder, Policy & Public auspices.

# Precision Land Use Management

**Coordinates and controls biophysical, technical and administrative processes of primary production by semi-automatic or automatic control systems in order to balance the spatio-temporal variability**

**of (1) products and services (output),  
of (2) management practices (input),  
and of (3) site and disturbance factors (exogene variabels)**

**in a way that maximizes biological and technical efectivity of the system while minimizing adverse effects on the environment.**

**4 key issues related to system control:**

**The goal (What**

**The purpose (What For)**

**The strategy (How)**

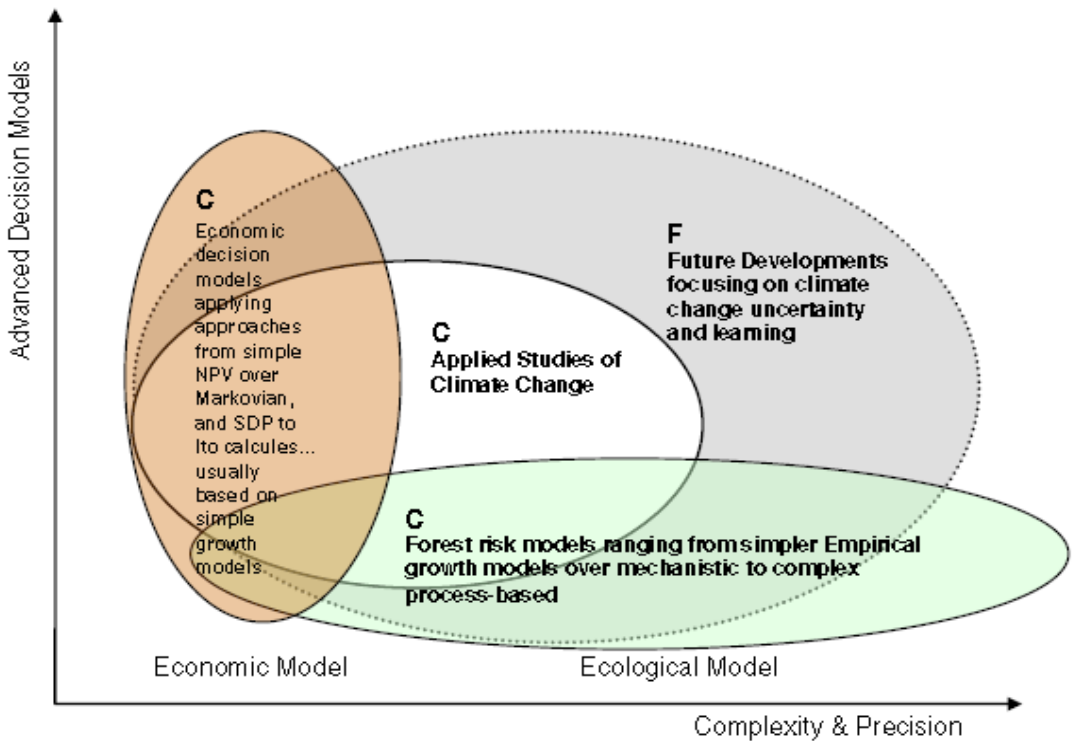

**The implementation (With What Type of Means).**

**The implementation requires sensors, technology, systems.**

**Heinimann, 2007, 2010**

# A review of decision-making approaches to handle uncertainty and risk in adaptive forest management under climate change

# POTREBA A MOŽNOSTI INOVÁCIE RÁMCOVÉHO PLÁNOVANIA HÚL NA SLOVENSKU

**Ladislav Kulla, Michal Bošela, Karol Burgan**

NLC-LVÚ Zvolen, T.G. Masaryka 22, 960 92 Zvolen

## **Abstrakt:**

Príspevok sa zaoberá možnosťami inovácie rámcového plánovania na Slovensku. Konštatujú sa silné a slabé stránky súčasného systému s ohľadom na trendy vývoja v zahraničí. Prezentované sú výsledky výskumu priestorovej variability prirodzenosti a produkcie hlavných drevín na Slovensku, ktoré sa využili ako podklad pre návrh zjednodušenia priestorovej a stanovištnej rajonizácie Slovenska pre potreby rámcového plánovania. Navrhnuté sú možnosti ďalšieho smerovania rámcového plánovania na Slovensku.

**Kľúčové slová:** rámcové plánovanie, prirodzenosť drevín, produkcia drevín, lesné oblasti, stanovištné jednotky, hospodárska úprava lesov

## **Abstract:**

Paper deals with possibilities of innovation of framework planning in Slovakia. Strengths and weaknesses of current system are stated, with regard to trends of forest planning development abroad. Research results are presented on spatial variability of naturalness and production of main tree species in Slovakia, which were used as a basis for proposal of simplification of spatial and site regionalization of Slovakia for purposes of framework planning. The opportunities of next development of framework planning in Slovakia are proposed.

**Key words:** framework planning, tree species naturalness, tree species production, forest regions, site units, forest management

# Forest management planning

## Slovakia

**Only one proposal of forest management plan (FMP) is elaborated.**

**Basic tool of the planning process - classical growth and yield tables.**

**Forest owners (stakeholders) participate in their own planning process only marginally.**

**Complex DSS absent**

## World

**Many alternative FMPs are proposed.**

**Basic tool of the planning process – a new generation of growth simulators.**

**Multicriterial optimization with regard to apriori known owner's goals and preferences.**

**Many DSSs exist**

# Why is only one alternative of FMP is elaborated ?

**Management actions for each stand are prescribed on the base of:**

Detailed survey of ecological and management conditions – soil, climate, forest type, forest-management groups of types etc.

Precise inventarization of current stand state – species composition, density, stand volume and quality, health status etc.

Complex evaluation of stand ecological stability – mechanical stability, naturalness of species composition, health status and so on.

Complex evaluation of fulfilling forest function – identification, quantification and integration of present forest functions and setting of main management goals (forest categorization).

**Management actions are selections from predefined optimal forest management model**

Forest management model – set of optimal basic forest management decisions, stand production targets and rules related to restoration, tending, harvesting, regeneration and protection valid for so called operational set.

Operational set – subset of forest stands with the same category (production, protection or social forests), stand origin (seed, coppice), degree of ecological stability and current species composition growing on the same site type.

**We mean/stated/believe that proposed FMP is optimal !**

# **What guaranties the optimality of the management actions given by forest management model ?**

## **Reasons**

**250 year-long history of forest management, silviculture and protection in Slovakia.**

**Unique phytocenological classification according to Zlatnik (1957).**

**High-quality growth and yield tables with known precision.**

**Clear methodology of identification, quantification and integration of forest functions on certain area.**

## **Beliefs**

**Belief that correct approaches of tending, harvest, restoration/regeneration, protection actions etc. are used.**

**Belief that we exactly know of target stand state corresponding to certain natural conditions.**

**Belief in correct determination of current stand state and its future development.**

**Belief in correct setting of management goals and preferences (especially strategic).**

# **Forest Management Problems in Slovakia (one of possible approximation)**

**High diversity of natural and management conditions in Slovakia. Problem to apply rather general recommendations and rules from operational sets to particular stand.**

**Most of actions and rules are defined only qualitatively. Too much space for a subjective decision making is allowed.**

**Absent of feedback among prescribed actions and their consequences. Actions are planned without risk assessment.**

**Low adaptability of the prescribed schematic approaches. Problem of implementing the new knowledge, absent of actions against climate change impacts etc.**

**Only limited (and mostly formal) participation of the forest owner and other stakeholder group in the process of FMP elaboration.**

## Main idea

**... major discrepancies between social perspectives and demands have been reflected in incoherent policy objectives, inconsistent instruments and management approaches for the conservation and sustainable management of forest ecosystems in the EU and the Member States...**

# INTEGRAL PROJECT STRUCTURE

## PHASE 1: Diagnosis

### WP 2.1

Ecological and technical  
analysis at the landscape  
level

### WP 3.1

Political, social, economic  
analysis at the EU/ national/  
landscape level

## PHASE 2: Exploration and Evaluation

### WP 2.2

Mapping scenarios into  
decision support systems and  
assessment of ecosystem  
services supply

### WP 3.2

Participatory scenario  
development  
at the landscape level

## PHASE 3: Problem- Solving

### WP 2.3

Effects of implementing policy  
options on ecosystem services  
at the landscape level

### WP 3.3

Policy back-casting for  
integrated forest  
management at the  
landscape/ national level

**WP 4: COMMUNICATION AND DISSEMINATION**

**WP 1: PROJECT COORDINATION**

## **Inovativnes and multidisciplinary**

**Application of the sophisticated methodologies and technology.**

**Tendency from description to the prescription (strategic prognosing, spatial decision support).**

## **Social dimension and participativity**

**Relevant stakeholders participation in the solution (owners, managers, state administration, other groups).**

**Questionnaires, workshops, interviews.**

## **Internationality and multisectorality**

**Common EU methodology, politics, legislative, management.**

**INTEGRAL is a collaboration project of universities and R&D institutes working on solutions for better forest management in Europe.**

### Background

In the European Union, the important environmental and socio-economic roles of forests are widely known. However, there are critical incoherencies between the forest-related policies at the European level and their implementation in the regions in the member states.

### Goals

The main objective of the four-year project INTEGRAL is to bring the landscape dimension closer to Europe. At the same time, the project provides demand-driven information for European policy decision makers on the challenges in forest management in 20 regions throughout Europe.

**INTEGRAL** provides solutions for:

- effective management strategies at the landscape level
- decision support tools for future-oriented and integrated forest management
- coherent EU policy instruments
